Figure 5. TFSEE identifies cell type-specific enhancers and their cognate TFs that drive gene expression during pancreatic differentiation

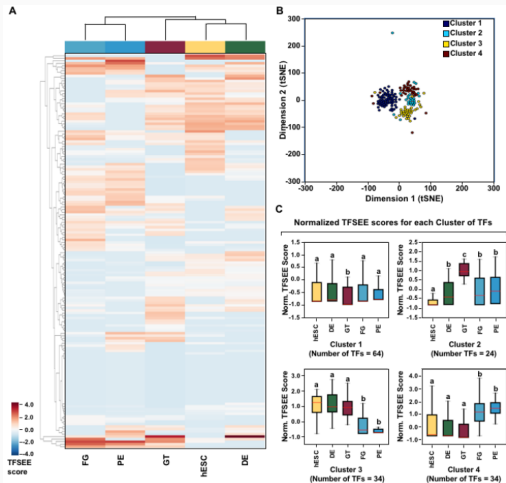

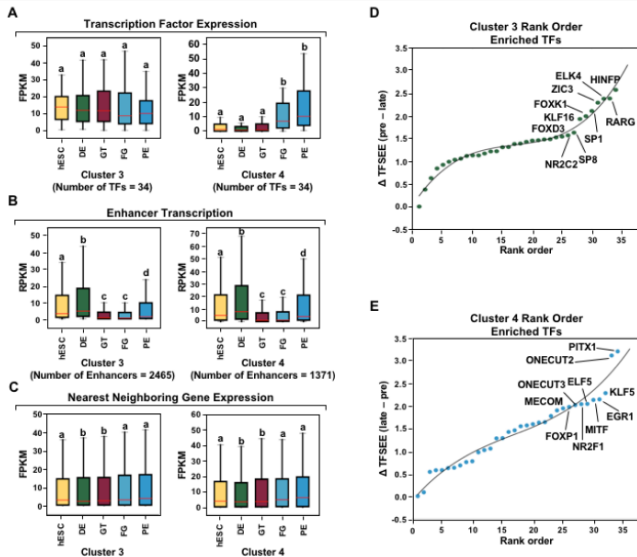

Figure 6. TFSEE-predicted TFs are enriched in pre and late pancreatic differentiation

# Strengths and Limitations

- TFSEE enables analysis of driver TFs using a limited amount of data
- The TFSEE model was able to identify lineage-specific TFs with as little as 5 cell types and with only 2 data types, RNA-seq and ChIP-seq (for H3K4me3, H3K4me1, and H3K27ac)
- A limitation of the TFSEE method is that while the model can be used with a reduced number of data types for enhancer identification, it fails to identify additional subtype- or stage-specific drivers with reduced data input

# Integrating additional genomic data into TFSEE

- Integrate genomic data indicating open regions of chromatin (ATAC-seq, DNase-seq, or MNase-seq)
- ChromHMM could be used to annotate alternate chromatin states with additional histone modifications
- Chromatin Looping data for enhancer-promoter interactions (as measured by 4C, ChIA-PET, or Hi-C)
